

Tesla Model S

By Collin Anselmi

What is a Tesla Model S?

Tesla Motors is a car company that specializes in making top quality, cutting edge cars that have a variety of special features. Some of these include internet connectivity, bluetooth, a driverless option, and can be powered electrically. This particular model of Tesla is the newest available.

Physical/Special Properties

Tesla Model S cars are very sleek and shiny, coming a variety of colors. The car is a sedan, and is marketed as “deluxe.” They are able to have a software update instead of being recalled, which saves the company money while also convincing the customer.

“Smart” Components

Like said earlier, cars can be essentially updated instead of being recalled. The car also has an onboard bluetooth and WiFi, enabling drivers to check social media, maps, or the game right from their car.

Interesting Story

In 2013, there were two instances where the low undercarriage of a Tesla car was scraped and caused a fire. None of the occupants of either of the cars were harmed, but just to be sure, Tesla Motors sent out a software update to all cars which raised the ground clearance of the vehicles.
