

Chronic or at-risk patients can be monitored using a lightweight wearable sensor that collects cardiac data which can be accessed by physicians at any time.

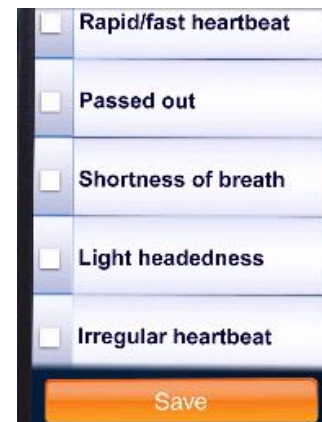

The BodyGuardian Heart is a remote monitoring system that allows patient's cardiac conditions to be monitored real-time.

Collected data are transmitted to an smart phone app which also provides trending analysis.

If the patient experiences a symptom at any time, the patient should press the **Record or Event button** on the monitor and identify the symptom by selection on a menu provided in the smart phone app.

The data is transmitted from the monitor to a monitoring center. Certified technicians will review it to check for any irregular heart rhythms and other conditions as directed by the doctor. The doctor will also be notified.
